Performance Testing Web Contact List App

Matriks Performance

Load User:

- Normal Load: Jumlah rata-rata pengunjung adalah 10 users
- Heavy Load:Jumlah maksimum pengunjung adalah 100 users

Response Time

Level	Response (seconds)	Description
Very Good	< 1	Sistem merespons cepat. User
		experience sangat bagus,
		sehingga user dapat
		berinteraksi secara langsung
Good	1-5	System merespons dengan
		cukup cepat. User sedikit
		merasakan delay, masih batas
		toleransi
Fair	5-10	Sistem mengalamai delay,
		sehingga user experience
		berkurang
Bad	>10	System merespons sangat
		lambat, user akan merasa
		frustasi

Skenario 1 : Fitur Account

1.1 Test Plan Scenario – Load Testing

a. Tujuan

Mengukur bagaimana respon system saat jumlah user tinggi selama periode waktu tertentu

b. Langkah-langkah

Skenario dimulai dengan 10 user, dan setting ramp-up period dimulai dengan 10 detik

c. Specification

THREAD GROUP

Number of Thread: 10Ramp-up Period: 10

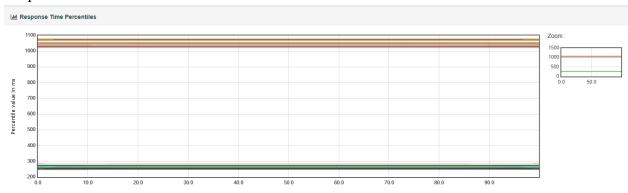

• Loop Count: 1

d. Result

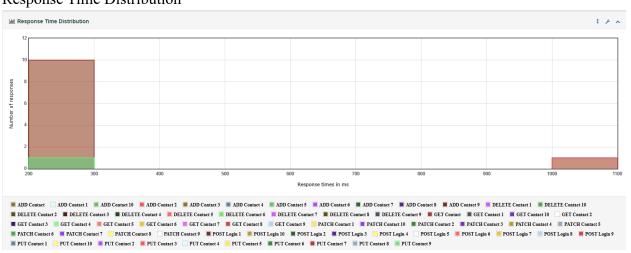

Dashboard

													S	Statistics													
ì	Requests Executions													Response Tim	es (r	ns)						Throughput		Networ	k (KI	B/sec)

Response Time Percentile

Response Time Distribution

Throughput – Hits Per Second

e. Kesimpulan

Berdasarkan hasil load test di atas, dapat disimpulkan rata-rata responsnya adalah 395.93ms (0,39 detik) dengan minimum 255ms (0,25 detik), dan maksimum 1077ms (1,07 detik) dengan error 0%. Ini berarti system berjalan dengan sangat bagus untuk scenario saat beban user tinggi

1.2 Test Plan Scenario – Stress Testing

a. Tujuan

Untuk mengetahui bagaimana respon system saat beban user yang diberikan tinggi dengan waktu yang singkat

b. Langkah-langkah

Simulasikan threads dimulai dengan jumlah 100 dengan ramp-up period-nya adalah 10 detik

c. Specification

Thread Group:

• Number of Thread (User): 100

• Ramp-Up Period (Seconds): 10

Loop Count: 1

d. Result

Dashboard

503/Service Unavailable

Top 5 Errors by Sampler

e. Kesimpulan

Dari hasil stress testing di atas, sebanyak 534 samples dikirim dalam waktu 10 detik, waktu rata-rata yang dibutuhkan adalah 2392.59 ms (2.39 detik) hal ini berarti system merespon dengan bagus, walaupun user akan mengalami delay sedikit. Namun, dengan maksimumnya adalah 30256ms (30.25 detik) ini berarti beberapa user akan mengalami delay yang sangat lama, dan beberapa user masih bisa mengakses system dengan cepat, yakni dengan minimum 244ms (0,24 detik). Lalu, dari 534 samples yang dikirim, 24.72% atau 132 samples gagal, dengan 99 di antaranya adalah unauthorized, ini berarti saat system mengalamai stress tinggi, user akan kehilangan authorized access saat di tengah-tengah pemakaian dan sisanya adalah Service Unavailable, yang berarti system tidak merespon sama sekali terhadap request oleh user, karena beban yang tinggi dalam waktu yang singkat. Dengan demikian performa system harus ditingkatkan Ketika beban yang diberikan tinggi dalam waktu yang singkat
